

1.

(a) RRNNNNNRNRNNNNNR

recall | 0.125 0.25 0.375 0.5 0.625 0.75
precision | 1 1 0.33 0.364 0.33 0.3

$$\Rightarrow P_{interp}(0.33) = \max_{r' \geq 0.33} p(r') = 0.364$$

$$(b) (1 + 1 + 0.33 + 0.364 + 0.33 + 0.3) / 8 = 0.4163$$

(c) largest \Rightarrow the rest 2 relevant docs are in rank 21th and 22nd.

$$\Rightarrow MAP = (1 + 1 + 0.33 + 0.364 + 0.33 + 0.3 + \frac{7}{21} + \frac{8}{22}) / 8 = 0.5034$$

smallest \Rightarrow They are in rank 9999th and 10000th.

$$\Rightarrow MAP = (1 + 1 + 0.33 + 0.364 + 0.33 + 0.3 + \frac{7}{9999} + \frac{8}{10000}) / 8 = 0.4165$$

2.

(a) Use "accuracy" can measure the difference

$$(b) (1 + 1 + 0.33 + 0.364 + 0.33 + 0.3) / 8 = 0.4163$$

(c) largest \Rightarrow the rest 2 relevant docs are in rank 21th and 22nd.

$$\Rightarrow MAP = (1 + 1 + 0.33 + 0.364 + 0.33 + 0.3 + \frac{7}{21} + \frac{8}{22}) / 8 = 0.5034$$

smallest \Rightarrow They are in rank 9999th and 10000th.

$$\Rightarrow MAP = (1 + 1 + 0.33 + 0.364 + 0.33 + 0.3 + \frac{7}{9999} + \frac{8}{10000}) / 8 = 0.4165$$

2.

(a) Use "accuracy" can measure the difference

$$\frac{\text{true positive} + \text{true negative}}{\text{collection size}}$$

(b) assume there are 20 relevant documents, and in 20 document the system retrieved, there are 10 relevant ones.

$$\Rightarrow ACC_{\text{before}} = \frac{tp + tn}{10000} = \frac{10 + ((10000 - 20) - (20 - 10))}{10000} = 0.998$$

$$ACC_{\text{after}} = \frac{10 + ((10000 + 5000 - 20) - (20 - 10))}{10000 + 5000} = 0.99867$$

\Rightarrow Accuracy reflects the system performs better in the new setting.

$$C_{ij}, i, j = 0 \dots n-1$$

$$\text{default: } (C_{00} + \dots + C_{0n-1}) - ((C_{00} + \dots + C_{0n-1}) - 0) = 0$$
